PREFACE

The preface in a report is something that comes before the report. This section will typically set up the stage for whatever your report is going to discuss. It may give some background information on the subject.

Normally a preface it will be a three paragraph length answer. The first paragraph should be explaining what you are investigating and why. the second should be the scope of your investigation. the third should be the conclusion that your investigation brought you to.

If your report does not have any preface, you may remove it from your latex.

CHAPTER 1

INTRODUCTION

1.1 Basic Introduction

Currently, the amount of vehicles on the road increases every year in Malaysia. It is because the local brand car is affordable by many low income level household. The manufacturer also provided promotions to attract people to buy car. So that, the number of non-professional driver rapidly increased in Malaysia. Most of the drivers are unskilled and lack of awareness on the traffic safety and vehicle condition. The driver's personal factors have become the main reason of causing the traffic incidents.

According to the general road accident data in Malaysia took from Malaysian Institute of Road Safety Research (MIROS) official website shown in Figure 1.1, the Malaysia government put effort on reducing the amount of traffic incidents by introducing the new traffic laws and speed track system. However, the number of cases of road deaths does not drop significantly.

General Road Accident Data in Malaysia (1997 – 2014)									
Year	Registered Vehicles	Population	Road Crashes	Road Deaths	Serious Injury	Slight Injury	Index per 10,000 Vehicles	Index per 100,000 Population	Index per billion VKT
1997	8,550,469	21,665,600	215,632	6,302	14,105	36,167	7.37	29.1	33.57

Figure 1.1: General Road Accident Data in Malaysia (1997 - 2014)

The driver characteristics and the occurrence of traffic incident is interrelated.

To further reduce the number of accidents, the safety equipment of the vehicle need to be improved as well as the road regulation, but also pay attention on driver behaviour.

1.2 Project Objective

1. To identify the features that contribute to the accuracy of the classification of the driver behavior analysis from the vehicle operation data.
2. To profile the drivers based on the vehicle operation data.

1.3 Research Motivation

This project is designed to capture actual driving behavior data by using sensor. The driver behavior will be analysed based on the vehicle operation data collected from the sensor plugged in the particular vehicle. This project will use the ELM327 as a device that communicates with the vehicle OBD-II interface. The GPS data and vehicle operation data will be collected through the application Torque(Lite) via bluetooth. The performance index for approach and alienation will be used in this project as a feature to analyze the drivers' driving behaviour. The driver who exceed the speed limit can be detected by using the vehicle speed and the GPS location information.

1.4 Project Scope

This project focuses on the driver behavior profiling. The vehicle operation data will be collected and pre-processed before execute the analysis. Each driver is required to drive the car at least 8 minutes for vehicle operation data collection. The data will be recorded in every second. For each driver, there are at least 480 records in the vehicle operation data file. After using the machine learning technique to classified the drivers, the drivers will be categorized to three classes. The classes are low risk, medium risk and high risk.

CHAPTER 2

RELATED WORK

2.1 Driver Behaviour Analysis through Speech Emotional Understanding

This paper was proposed by N. Kamaruddin and A. Wahab. The researchers analyzed the driver behavior state (DBS) based on the emotion of the driver when the driver was driving. The emotion of the driver can be detected through speech. The scholars used the Berlin dataset and NAW dataset as training set. The Berlin dataset and NAW dataset are standard dataset for speech emotion recognition and have been used by many researchers. The proposed method used the Generic Self-organizing Fuzzy Neural Network (GensoFNN) as a classifier for identification purpose.

2.1.1 Generic Self-organizing Fuzzy Neural Network (GensoFNN)

Fuzzy neural network is the combination of neural network and fuzzy inference system. It contains the interpretability of fuzzy inference system and the adaptability of neural network. GensoFNN is a classifier that can generate consistent result as it is able to do self-clustering process of the training data.

2.1.2 Driver Behavior Analysis Method

This proposed method collected data from 11 adults (3 female and 8 male). The drivers have at least two years of driving experience and drive at least 10 hours per week. The drivers are required to do four designed actions. The actions are:

1. driver talking through the mobile phone while driving.
2. driver feeling sleepy.
3. driver laught while driving

4. driver in the initial driving exercise where the driver is in neural state of emotion.

A microphone is embeded in the vehicle to collect the speech of the driver while driving. The experiments to analyzed the three DBS of talking, laughing, and sleepy were conducted. The scholar use the Berlin dataset and NAW dataset to related the three DBS with the angry, happy, and sad emotion.

2.1.3 Conclusion

The results were showed that the sleepy DBS can be recognized as sad emotion consistently. However, the talking and laughing DBS gave mixed results. It means that more work need to be conducted for better classification of the two DBS. The accuracy of sleepy emotion detection is up to 65% using the proposed speech emotion recognition system.

2.2 Driver Behaviour Analysis and Route Recognition by Hidden Markov Models

This paper was proposed by Amardeep Sathyanarayana, Pinar Boyraz, and John H.L. Hansen. This paper introduced the driver behaviour modeling using Hidden Markov Models (HMM) in Bottom-to-Top Approach and Top-to-Bottom Approach.

In the Bottom-to-top approach, the maneuvers are the smallest unit to be recognized by the algorithms. The driver behavior can be discovered from the recognized maneuvers and be used to build the maneuver models. The multi-maneuver models use the maneuvers model to be built and finally become a complete route. The Bottom-to-Top approach is to detect the distratcion of driver based on the comparision of the neutral state vehicle operation data in the known maneuvers.

In Top-to-Bottom approach, it is an opposite approach in driving behavior modeling. A single HMM is used to parse the route to the individual meaningful parts like maneuvers and states. The result of this approach is that the driver behavior in inter-

section will be identified by using three main clusters. The Top-to-Bottom approach is to recognized the route based on the vehicle operation data.

2.2.1 Data Collection

The proposed method used UTDrive Vehicle to collect the data. The UTDrive Vehicle is converted from a Toyota RAV4 vehicle. The UTDrive Vehicle is equipped camera to capture the driver and the road. The driver speech also been recorded by the equipped microphone in the vehicle. Distance sensor using laser and GPS for position measurement are also equipped. The CAN-Bus is used to collected the vehicle speed, steering wheel angle, and brake/gas information. The vehicle also equipped gas/brake pedal pressure sensors.

The experiment conducted in two different areas in order to collect two different scenarios data. The residential and commercial area including the right turn, left turn and lane change were selected for drivers to drive through. The drivers were required to drive two times with neutral driving and distracted driving.

2.2.2 Conclusion

Three different types of maneuvers (left turn, right turn, and lane change) were well recognized by using the three CAN-Bus signals (vehicle speed, steering angle, and brake force). On the other hand, the distraction detection was well recognized and having 95% accuracy.

2.3 Driving Behavior Analysis Based on Vehicle OBD Information and AdaBoost Algorithms

This paper was proposed by Shi-Huang et al.(2015). The researchers analyzed the drivers' behavior based on the on board diagnostic (OBD) information and using the AdaBoost Algorithms to create the driving behavior classification. Finally, the experimental results show the correctness of the proposed driving behavior analysis method has 99.8% accuracy rate in various driving simulations.

2.3.1 AdaBoost Algorithms

AdaBoost is a classification machine learning algorithm. The AdaBoost algorithms is to form a strong classifier by combining the a large number of weak classifier. There are three different types of AdaBoost algorithms. They are Gentle AdaBoost, Modest AdaBoost and Real AdaBoost.

2.3.2 Driving Behaviour Analysis Method

This proposed method used the OBD-II ssytem in the vehicle and EZ-SCAN5 as the OBD-II to Bluetooth adapter to collect the vehicle operation information. OBD-II is proposed in 1996 to replace the OBD-I system. The OBD-II system is implemented in every vehicle under the Environmental Protection Agency (EPA) regulation in USA since 1996. When the air-pollution contents exhausted by the vehicle exceed teh minimum level,the OBD-II system of the particular vehicle will generate the Diagnostic Trouble Code (DTC) message and Check Engine light will display on the vehicle dashboard. In order to communicate with the OBD-II system of the vehicle, EZ-SCAN5 as a OBD-II to Bluetooth adapter is required. The EZ-SCAN5 support most of the OBD-II communication protocols, such as SAE J1850 PWM, SAE J1850 VPW, ISO 9141-2, ISO 14230-4 KWP, and ISO 15765-4 CAN. If the communication protocol of the OBD-II system is not supported by the adapter, the vehicle operation information will not be able to retrieve.

This proposed method collected vehicle speed, engine speed(RPM), throttle position and engine load as the vehicle operation information. According to the engine characteristic curve, the proposed method developed two criteria for the data collection.

1. The normal vehicle condition data

The relative ratio of the vehicle speed and the engine speed is remained in a range that between 0.9 and 1.3. The result was tested in the same gear. The relative ratio of the engine speed and throttle valve is remained in a range that

between 0.9 and 1.3. The engine load is remained between 20% and 50%.

2. The bad vehicle condition data

The relative ratio of the vehicle speed and the engine speed is out of the range that between 0.9 and 1.3. The result was tested in the same gear. The relative ratio of the engine speed and throttle valve is out of the range that between 0.9 and 1.3. The engine load is out of the range that between 20% and 50%.

2.3.3 Vehicle OBD information Data Preprocessing

The proposed method used three characteristics. The three characteristics are the relative ratio of the vehicle speed and engine speed, the relative ratio of throttle position and engine speed, and engine load. Using the characteristics to analyzed the current state of the driving behavior whether the driver is in safe state or dangerous state. The proposed method needed to compute the change rate of vehicle speed, engine speed and throttle position in the first step. The calculation shown in Equation(2.1), where $t_2 - t_1 = 1$.

$$D(t) = \frac{data(t_2) - data(t_1)}{t_2 - t_1} \quad (2.1)$$

The next step is to calculate the relative ratio of the vehicle speed and engine speed, and the relative ratio of the throttle position and engine speed. The calculation shown in the Equation(2.2) and (2.3).

$$R_{cz}(t) = \frac{cs(t)}{220} \div \frac{zs(t)}{8000} \quad (2.2)$$

where $R_{cz}(t)$ is the relative ratio of engine speed and vehicle speed. $cs(t)$ is the vehicle speed at time t . The 220 is the value of maximum vehicle speed. $zs(t)$ is the engine speed a time t . The 8000 is the value of maximum engine speed of the vehicle.

$$R_{jz}(t) = \frac{jq'(t)}{\max(jq')} \div \frac{zs'(t)}{\max(zs'(t))} \quad (2.3)$$

where $R_{jz}(t)$ is the relative ratio of engine speed and throttle position. The $jq'(t)$ is the change rate of the throttle position at time t . $zs'(t)$ is the change rate of the engine speed at time t . The $\max(jq'(t))$ and $\max(zs'(t))$ is the maximum value of the change rate of throttle position and engine speed, respectively.

Based on the two computed features and engine load, this three features were combined to determine the vehicle data is normal or bad driving behavior.

2.3.4 Experimental Results

The proposed method used the toolkit-GML-AdaBoost-matlab of MATLAB to execute data preprocessing and driving behavior modeling. The preprocessed data is tested on three diferent types of the AdaBoost algorithms. They are Gentle AdaBoost, Modest AdaBoost and Real AdaBoost. The Real AdaBoost are better than other Ad-aBoost algorithms with the highest accuracy rate, 99.8%.

CHAPTER 3

CHAP-THEORITICAL

3.1 Vehicle Operation Data Collection Based on OBD system

The behaviour of the driver is hard to be identified. The driver behavior is affected by environment, vehicle condition and the mental or physical state. One way to identify driver behaviour is using the vehicle operation data.

The OBD system is also called OBD-II, was proposed in 1996. In 1996, all the cars manufactured in United State (US) were required to equip OBD-II and the cars without OBD-II prohibited to sell in US. The purpose to have OBD-II specifications is to diagnose engine problem. The specifications were being used by the Environment Protection Agency (EPA) and the state of California to meet the emission standards. Since 1996, all the cars in US are required to be equipped with OBD-II to establish the EPA regulation.

The usage of the OBD-II is important for detecting the vehicle exhaustion. If the vehicle is exhaust high level of air-pollution content, Diagnostic Trouble Codes (DTCs) will be geneated by the OBD-II and a Check Engine Light will be displayed on vehicle dashboard. OBD-II will store this DTCs into the ECU's memory. An OBD-II scanning tool can access the Engine Control Unit (ECU) to retrieve the DTCs.

The OBD-II is usually installed under the vehicle dashboard and above the pedals.

3.1.1 ELM327

ELM327 is an OBD-II scanning tool produced by ELM Eletronics. It is a programed microcontroller to communicate with the OBD-II port of the vehicle. The

ELM327 supports most of OBD-II protocols. ELM327 also contains the bluetooth adapter. The ELM327 needs to be plugged to the OBD-II port.

3.1.2 Torque(Lite)

Torque Lite version is a free android application and it is able to be installed in smartphone from Google Play Store. The application will communicate with the ELM327 through the bluetooth connection. The application will collect the data received from the ELM327 and save the data into a .csv file in the smartphone.

After vehicle ignition is on, ELM327 need to connect with the smartphone that operating Torque via Bluetooth. Once the smartphone connected with the adapter, Torque will choose the protocol that matches with the OBD-II system. After the matching succeeded, Torque will start to read the sensor information from the ECU. In order to collect the GPS data, smartphone's location service is required to be enabled at the same time. When the smartphone received GPS signal and connected with the adapter, there are four flashing icons at the top right of the main screen will stay solid with blue color.

3.2 KNIME Analytics Platform

KNIME Analytics Platform is an open platform for data analysis. It is a perfect tool for data scientists.

KNIME Analytics Platform contain 1000 modules ,hundreds of ready-to-run examples, a set of integrated tools, and a list of advance algorithms available. User can build a machine learning experiment by dragging and dropping the related modules into the project. User needs to link and configure the module before execution.

CHAPTER 4

RESEARCH METHODOLOGY

4.1 Driving Operation Data Acquisition

For this project, ELM327 OBD-II Bluetooth Car Diagnostic Interface is required to collect the vehicle operation data. The device needs to be connected with the OBD-II socket of the vehicle. Few drivers had been invited to drive the vehicle that connected with the device.

A smartphone that installed Torque Lite version Android application is needed to collect the data. The drivers need to put the particular smartphone inside the vehicle while they are driving. After the driving session, a CSV file will be generated by the Torque and stored in the file directory of the smartphone. The CSV file will be uploaded to the Google Drive. In the end, the Google Drive stored few CSV files after different drivers' driving session.

For this project, the vehicle OBD-II information data and Global Positioning System (GPS) data need to be collected. The vehicle OBD-II information data include the vehicle speed, engine speed, engine coolant temperature, throttle position, and acceleration sensor. The GPS data include latitude coordinate, longitude coordinate, GPS speed, GPS altitude, horizontal dilution of precision, GPS bearing, and GPS acceleration.

4.2 Driving Operation Data Preprocessing

The first 30 rows and last 30 rows of the collected vehicle operation data need to be unselected. It is because drivers just come out from the parking at the beginning or drive into a parking slot at the end of the driving session.

4.3 Feature Derivation

In this project, features have been derived from the collected vehicle operation data and GPS data. The first derived feature is speed limit condition. The speed limit condition is an attribute to define whether the driver exceeded the speed limit at the particular location and time. The value of the speed limit condition is "Yes" or "No".

In order to get the value of speed limit condition, the road condition needs to be specified first. The road condition can be specified by using GPS Bearing and GPS coordination. The change rate of the GPS Bearing can be used to determine the driver is driving straight or turning. Different areas have different speed limitations. The GPS coordination is used for determining the driving area. The speed limit of the roads will be used for determining the speed limit condition.

CHAPTER 5

CONCLUSION

5.1 Introduction

In this last chapter, you may outline the success of your project when compared to the objectives that were set. You may suggest further work for your research area.

5.2 Conclusion

A good final year report should summarise the most important findings and conclude. Always make explanations complete. Avoid speculation that cannot be tested in the foreseeable future. Discuss possible reasons for expected or unexpected findings.

APPENDIX A

MANUALS, TECHNICAL SPECIFICATIONS, DOCUMENTATIONS, EXAMPLE SCENARIOS

You may want to include appendix in your report. Appendix such as manuals, technical specification, or documentations. You should **NOT** include all your source codes as appendix. Generally source code should be included in CD/DVD and **NOT** in your report.

APPENDIX B

APPENDIX 2: WHAT IS APPENDIX

Appendix is included in your report as it is information that is not essential to explain your findings, but that supports your analysis (especially repetitive or lengthy information), validates your conclusions or pursues a related point should be placed in an appendix (plural appendices). Sometimes excerpts from this supporting information (i.e. part of the data set) will be placed in the body of the report but the complete set of information (i.e. all of the data set) will be included in the appendix. Examples of information that could be included in an appendix include figures/tables/charts/graphs of results, statistics, questionnaires, transcripts of interviews, pictures, lengthy derivations of equations, maps, drawings, letters, specification or data sheets, computer program information.

There is no limit to what can be placed in the appendix providing it is relevant and reference is made to it in the report. The appendix is not a catch net for all the semi-interesting or related information you have gathered through your research for your report: the information included in the appendix must bear directly relate to the research problem or the report's purpose. It must be a useful tool for the reader

NOTES

1. This is a footnote, or rather an endnote. Note that footnotes/endnotes are not encouraged in scientific and engineering disciplines.
2. don't you agree?
